

Incidental Finding Project - MRRC

Current System

- MRRC techs or Study Team send Dr. M an email to review scan for incidental finding
- Dr. M emails word document report to study team

Primary Issues

- Requests are only sent to Dr. M email
- Lacking database to search if already reviewed scan
- requests are duplicated, difficult to track
- OHIF viewer

Dr. Wish List

- Better image viewer and ability to annotate images (XNAT viewer is very clunky and not generally accessible to others)
- Make these anonymized images available to clinicians to view on demand
- Have "patient context" established for developing a report (ie automatically link with a IRB specific or generic MRRC reporting template)
- Store report in a centralized system accessible by others (not just in my OneDrive or whatever other archive is kept when I email the results to PIs/MRRC)
- Facilitate viewing/review of the imaging by other staff and fellows (there has been talk of having the trainees help with imaging review)
- have a system that allows imaging consultation to be requested for incidental review and keeps track of PI/research group
- Ideally manage/integrate imaging of volunteer subjects that are imaged across different projects and under different IRBs/research user IDs, potentially flagging subjects that are unsuitable for inclusion prior to imaging (ie, some volunteers with pre-existing major structural brain variants/abnormalities).
- Potentially integrate a mechanism for breaking anonymization and uploading the research imaging as identified data into the patient's record; I've been reluctant to go here, but there is a precedent set at other institutions that do this (Wash U for example).
- Is there a role for an AI-compatible/adaptable component (thinking future oriented for growth into an automated screening of research imaging data)?
